

# ***Carbapenemase-producing Enterobacteriaceae I am colonised / have an infection – what does this mean?***

## **What are ‘carbapenemase-producing Enterobacteriaceae’?**

Enterobacteriaceae are bacteria that usually live harmlessly in the gut of humans. This is called ‘colonisation’ (a person is said to be a ‘carrier’). However, if the bacteria get into the wrong place, such as the bladder or bloodstream they can cause infection. Carbapenems are one of the most powerful types of antibiotics. Carbapenemases are enzymes (chemicals), made by some strains of these bacteria, which allow them to destroy carbapenem antibiotics and so the bacteria are said to be resistant to the antibiotics.

## **Why does carbapenem resistance matter?**

Carbapenem antibiotics can only be given in hospital directly into the bloodstream. Until now, doctors have relied on them to successfully treat certain ‘difficult’ infections when other antibiotics have failed to do so. In a hospital, where there are many vulnerable patients, spread of resistant bacteria can cause problems.

## **Do I need treatment?**

If someone is a carrier of carbapenemase-producing Enterobacteriaceae (CPE), they do not need to be treated. However, if the bacteria have caused an infection then antibiotics will be required.

## **How did I ‘pick up’ CPE?**

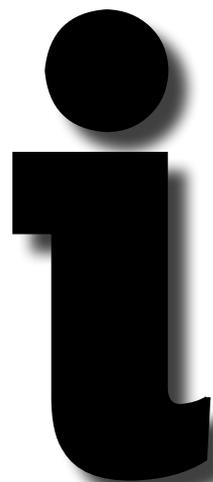

Ask your doctor or nurse to explain this to you in more detail. As mentioned above, sometimes this bacteria can be found, living harmlessly, in the gut of humans and so it can be difficult to say when or where you picked it up. However, there is an increased chance of picking up these bacteria if you have been a patient in a hospital abroad or in a UK hospital that has had patients carrying the bacteria, or if you have been in contact with a carrier elsewhere.

## **How will I be cared for whilst in hospital?**

You will be cared for in a single room with toilet facilities. To check if you

are still carrying the bacteria the nurses will take swabs. These are taken from various areas such as where the tube for your drip (if you have one) enters the skin, a rectal swab i.e. a sample taken by inserting a swab briefly just inside your rectum (bottom), and/or a faecal sample. You will normally be informed of the results within 2 to 3 days.

## **How can you prevent the spread of CPE?**

- Caring for you in a single room helps to prevent spread of the bacteria.
- Healthcare workers should wash their hands regularly. They will use gloves and aprons when caring for you.
- The most important measure for you to take is to wash your hands well with soap and water, especially after going to the toilet.
- You should avoid touching medical devices (if you have any) such as your urinary catheter tube and your intravenous drip, particularly at the point where it is inserted into the body or skin.
- Visitors will be asked to wash their hands on entering and leaving the room and may be asked to wear an apron.

## **What about when I go home?**

Whilst there is a chance that you may still be a carrier when you go home quite often this will go away with time. No special measures or treatment are required; any infection will have been treated before you leave hospital. You should carry on as normal, maintaining good hand hygiene. If you have any concerns you may wish to contact your GP for advice. Before you leave hospital, ask the doctor or nurse to give you a letter or card advising that you have had an infection or been or are colonised with CPE. This will be useful for the future and it is important that you make health care staff aware of it. If you or a member of your household are admitted to hospital, you should let the hospital staff know that you are, or have been a carrier and show them the letter/card.

## **Where can I find more information?**

If you would like any further information please speak to a member of your care staff, who may also contact the Infection Prevention and Control Team for you.
